

# INTRODUCTION TO ELECTRICALLY CONDUCTIVE ELASTOMERS

## OVERVIEW

The electrically conductive elastomers are based on dispersed particles in elastomers, oriented wire in solid or sponge elastomers, impregnated wire mesh screens or expanded metals. They provide highly conductive, yet resilient gasketing materials for EMI sealing as well as pressure and environmental sealing.

Conductive elastomers are used for shielding electronic enclosures against electromagnetic interference (EMI). Usually, the shielding system consists of a conductive gasket sandwiched between a metal housing and lid. The primary function of these gaskets is to provide sufficient electrical conductivity across the enclosure/gasket/lid junction to meet grounding and EMI shielding requirements, as well as prevent intrusion of the fluids into the electrical components.

Laird offers conductive elastomers in the following forms:

1. ElectroSeal dispersed filler particles in elastomers
2. ElectroMet oriented wire in solid and sponge elastomers, and impregnated wire mesh and expanded metals

## ELECTROSEAL™ GASKET INTRODUCTION

Conductive elastomer gaskets are EMI shielding and sealing devices made from highly conductive, mechanically resilient and conformable vulcanized elastomers. They are available in the following types:

1. Flat gaskets or die-cuts
2. Molded shapes such as O-rings or intricate parts
3. Extruded profiles or strips
4. Vulcanized-to-metal covers or flanges
5. Co-molded or reinforced seals
6. Form-in-place gaskets

When any two flat, but rigid surfaces are brought together, slight surface irregularities on each surface prevent them from meeting completely at all points. These irregularities may be extremely minute, yet may provide a leakage path for gas or liquid under pressure, and for high frequency electromagnetic energy. This problem remains in flange sealing even when very high closure force is applied.

However, when a gasket fabricated of resilient material is installed between the mating surfaces, and even minimal closure pressure is applied, the resilient gasket conforms to the irregularities in both mating surfaces. As a result, all surface imperfections and potential leak paths across the joint area are sealed completely against pneumatic and fluid pressure or penetration by environmental gases. If the gasket is conductive as well as resilient, with conductive matrix distributed throughout its total volume in mesh or particle form, the joint can be additionally sealed against penetration by, or exit of, electromagnetic energy.

## PRODUCT SELECTION GUIDE

### ECE POLYMER MATERIAL MATRIX

	<b>Benefit</b>	<b>Ag (Silver)</b>	<b>AgCu</b>	<b>AgNi</b>	<b>AgAl</b>	<b>AgGlass</b>	<b>Ni</b>	<b>NiAl</b>	<b>NiGraphite</b>	<b>Carbon</b>	<b>Non-Conductive</b>
Silicone	good all purpose material	ECE082/083	ECE080/094	ECE084	ECE081	ECE085	ECE100	ECE032	ECE072/093	ECE087	NCE220
Fluorosilicone	fuel and oil resistant	-NA-	ECE088	ECE090	ECE050/089	ECE011	-NA-	-NA-	ECE092	-NA-	-NA-
EPDM	biohazard resistant	-NA-	-NA-	-NA-	ECE096	-NA-	-NA-	-NA-	ECE095	ECE013	-NA-

### FIP RESIN MATRIX

	<b>Benefit</b>	<b>AgCu</b>	<b>AgNi</b>	<b>AgAl</b>	<b>NiGraphite</b>	<b>Non-Conductive</b>
RXP - room temperature cure	simple dispense process	SNK55	SNN60	SNL60	SNC70	SIL25
HXP - heat cure	longer shelf life	SNK60	SNN65	SNL70	SNC70	SIL35

# ELECTROSEAL CONDUCTIVE ELASTOMER

## CASE STUDY

### EXAMPLE

A Telecommunication customer A is looking for a gasket for RRU chassis. The chassis will be made of Aluminum by casting. There is an existing design including groove. Groove dimension is as follows. The customer is looking for an electromagnetic shielding larger than 50 dB for the chassis. And high reliability is required considering RRU unit will be exposed in open air and sustain various weather condition such as snow, rain, fog, etc.

	Selection Process	Conclusion
<b>Select elastomer base</b>	Take reference of Table 1	Silicone
	All the three bases can meet resistance requirement against weather, but silicone is the most cost effective one. And also best on availability and processibility.	
<b>Select filler system</b>	"Take reference of Table 3 for galvanic performance and Material Selection Table 6 1. Ag/Al filler would be most compatible with casting aluminum. 2. Ni/Graphite is a cost effective solution but still acceptable. Can be a candidate for future cost/performance comparison. 3. Better use a hybrid design considering high reliability requirement. 4. Both filler system can provide high shielding. But final performance would rely also on final design."	"Hybrid (NCE+ECE), ECE81(Ag/Al) or ECE93(Ni/Graphite) "
<b>Design Shape &amp; Dimension</b>		
Closure force	Medium closure force required because the RRU unit need to sustain water flush without high pressure	Hollow cross section
Is there an existing design? (part/groove/flange/interface)	There is an existing groove design. But can not find corresponding groove recommendation in brochure. Would need a design on gasket. Contact Laird FAE for it.	
What's the shape?	Existing groove design is rectangle shaped. A standard double D co-extrusion might work	Double D co-extrusion or custom design
Decide dimension	"Filling percentage >90% to bear water flush Compression >=25% considering large coplanarity of chassis and cover Final FEA possible to confirm the design Co-extrusion required because the total length is 1600 mm"	
How to mount the gasket?	Would need a PSA to hold the strip in groove	
	But a friction fit design can also be done for easy assembly and cost saving. Example

Little to no weight loss on metal coupon; less than 0.25%. Acceptable in all environments.

Substantial amount of weight loss on metal coupon; between 0.50% and 1.25%. Not acceptable in corrosive environments; for less corrosive applications consult with Laird applications engineer.

Moderate amount of weight loss on metal coupon; between 0.25% and 0.50%. May not be acceptable in very corrosive environments.

Extreme amount of weight loss on metal coupon; greater than 1.25%. Not recommended in any environments.

## ELECTROSEAL™ CONDUCTIVE ELASTOMER EMI SHIELDING

Laird electrically conductive elastomer products are ideal for both military and commercial applications requiring both environmental sealing and EMI shielding. Compounds can be supplied in molded or extruded shapes, sheet stock, custom extruded, or die-cut shapes to meet a wide variety of applications.

Our conductive extrusions offer a wide choice of profiles to fit a large range of applications. The cross-sections shown on the following pages are offered as standard. Custom dies can be built to accommodate your specific design.

- Available in a wide variety of conductive filler materials
- Shielding effectiveness up to 120 dB at 10 GHz

## SHEET MATERIAL

The Table below lists thicknesses and sizes for our molded sheet material, while Table 3, page 82, shows the compounds available for all of our conductive silicone elastomers.

## HOW TO SPECIFY ECE

Decide on molded sheet stock or extruded shapes. Select the desired configuration and dimensions from Table 1 (for sheet stock) or page 85 (for extruded shapes). Select the desired material from Table 3. Insert material number from Table 3, page 82, in place of the letters XX in the Laird part number.

## Example

1. From page 87, for a rectangular strip measuring 0.500 in. (12,7 mm) x 0.075 in. (1,9 mm), part number is 8861-0130-XX.
2. From Table 3, on page 82, for silver-nickel filler, material number is 84.
3. Ordering part number is 8861-0130-84.\*

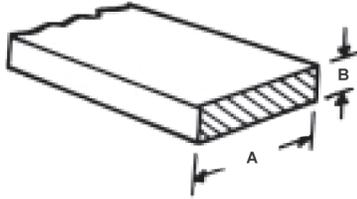

Note: Rectangular and D-shaped extrusions can be supplied with pressure sensitive adhesive tape.

\*If pressure sensitive adhesive is required, replace the fifth digit with a 9 (i.e. 8861-9130-84).
